

**ABSTRACT OF THE DISCLOSURE**

A misting system for a vehicle having a water pump uses a connector for splicing into a water line of the vehicle. A valve is coupled to the connector for activating and deactivating the misting system. Opening the valve causes pressure in the water line to be lessened thereby causing the water pump to activate and supply more water to the water line. A filter is coupled to the valve for removing particulates from the water in the water line. Piping is coupled to the filter. The piping will have watertight quick connect/disconnect connectors for quickly assembling the piping. Misting nozzles are coupled to the piping for spraying a fine mist of water in the air.
